

## Empirical finding

## Interpretation

## Institutional response

Targeted sex/gender removal: no family-wise change in review-list yield

No detected loss under the evaluated conditions; not proof of equivalence or fairness

Consider locally, with subgroup and list-membership audit

Socioeconomic/family removal: losses in OULAD and UCI 697

Different information groups cannot be treated as interchangeable

Test necessity and performance before removing or retaining fields

Effects changed with educational stage and review capacity

One operating point does not describe educator-facing practice

Evaluate the stage and staffing capacity in which educators will act

Excluded attributes remained predictable; the no-click fallback was weaker

Direct deletion and data unavailability create distinct governance trade-offs

Plan residual-information, fallback, and abstention checks

**Prospective next step: evaluate educator workload, decision quality, timeliness of support, possible harms, and student outcomes**
